1.35 million hectares of wheat were planted in the core region

GEA

The commercial year would be a new productive record. 1.35 million hectares were planted and the production is estimated at 20 million tons. 75% of the plots of wheat are in excellent to very good condition. 27% of the plots are in tillering, 44% are in the foliation stage and the rest is emerging. There are no water limitations. Harvest of late corn 17/18 The corn harvest advanced despite the fact that the grains are very humid. Humidity does not fall from 18 to 19% but it is collected the same for fear of broken and falling plants. The advance reaches 80%. The yields average 5,6 Tn/ha, almost 2,0 tons less than those of a normal year. Soybean quality 18/19 The analysis of soybean seeds that will be planted next campaign began. The first results show good data. Batches of plots harvested before the rains of April 2018 would be within the limits. Those that come from plots harvested after the rains, are not giving good results.
